## Web Design Task 3

### 1. Explain

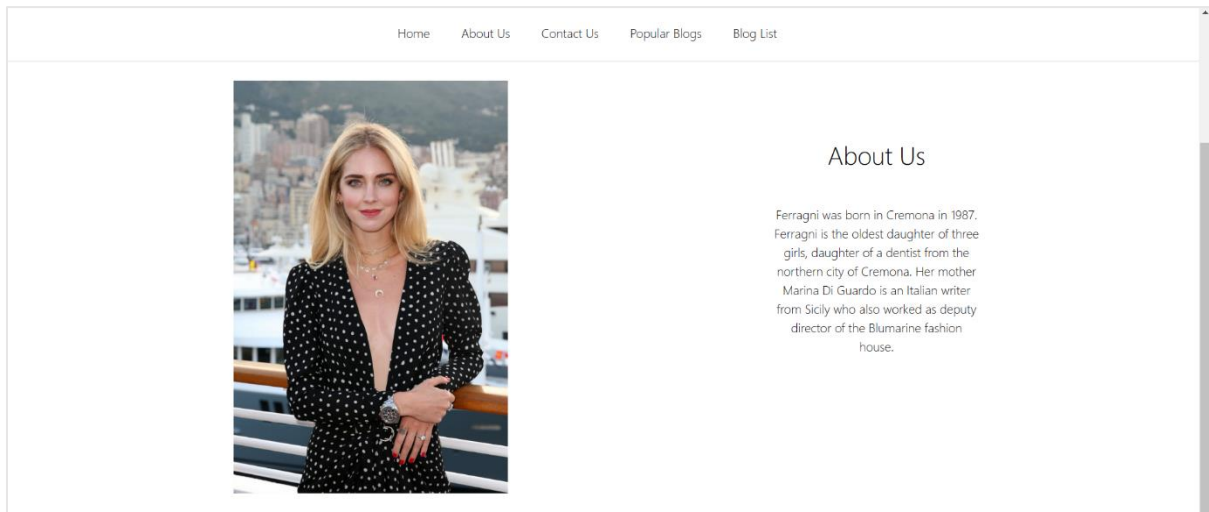

The first thing that I did was link the home page with a stylesheet in line 4, then I made other HTML pages to link them all together with the div element inside a nav from line 18 that formed the navbar on all the pages, which started the basic layout, I then did the header in each page and put it before the navbar so it comes up the first thing. The other thing I did that was on all the pages was the footer in the last part of the code.

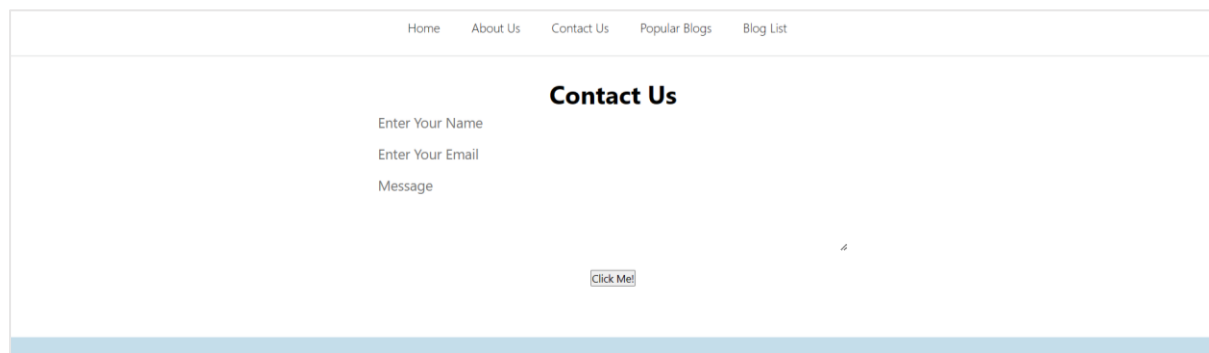

After I finished the basic layout on all the pages, I started adding the different elements, first one was the home page, I added the images in a column and in a row in line 40 and I included the width with the image source. I then added an h1 to include some text in line 54. And the last thing I did on that page was add two more pictures under the text with the same code as the ones before just different image links in line 61.

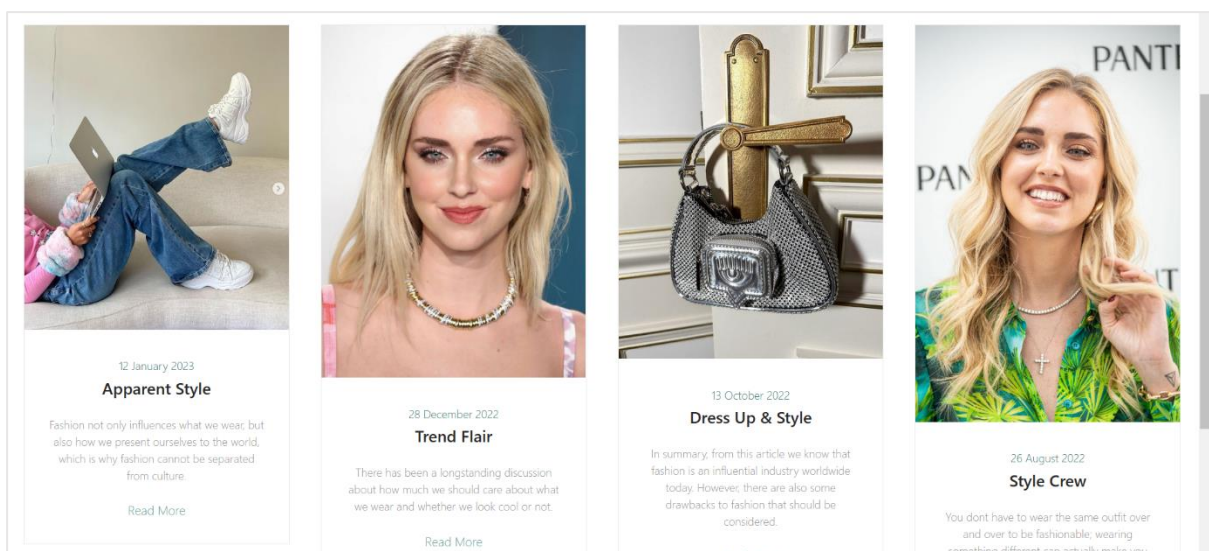

The second page is the About Us page, it didn't have that much of elements. After the header and navbar, I added a paragraph in a div element in line 34, and in another separate div element, I added an image source in line 42.

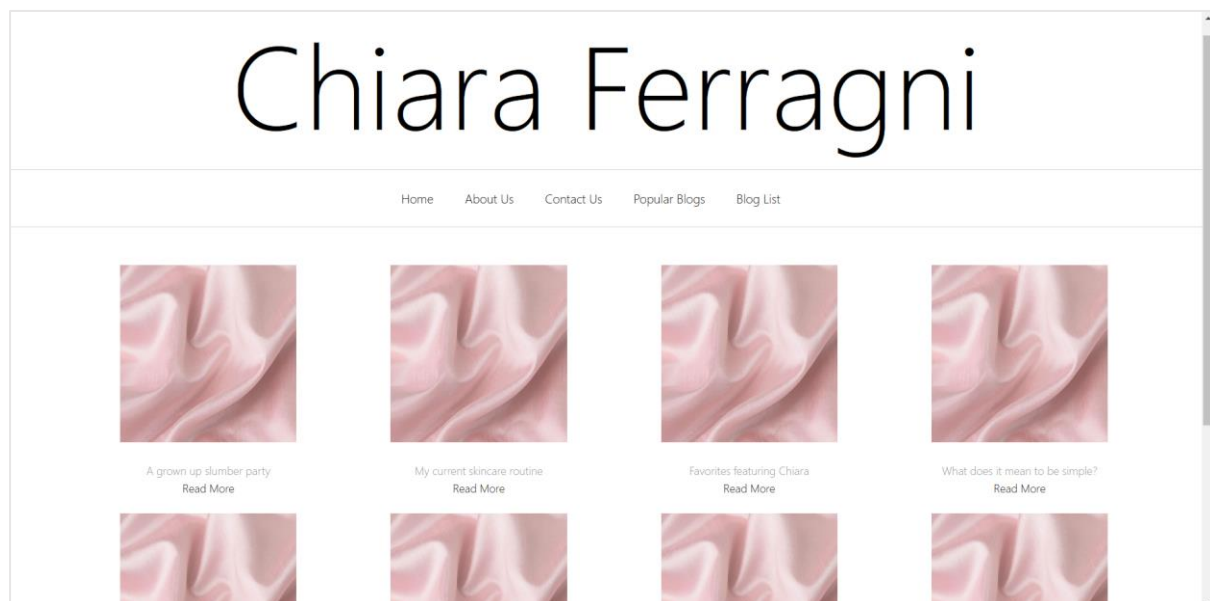

The third page is the Contact Us page, the first thing I did was a header in a div element to make the “Contact Us” in line 39. After that, in line 46 I made two inputs with a break in between each line for the name and email, and then I added a text area where you can write the message you want to send. The last thing I did was the button that says click me.

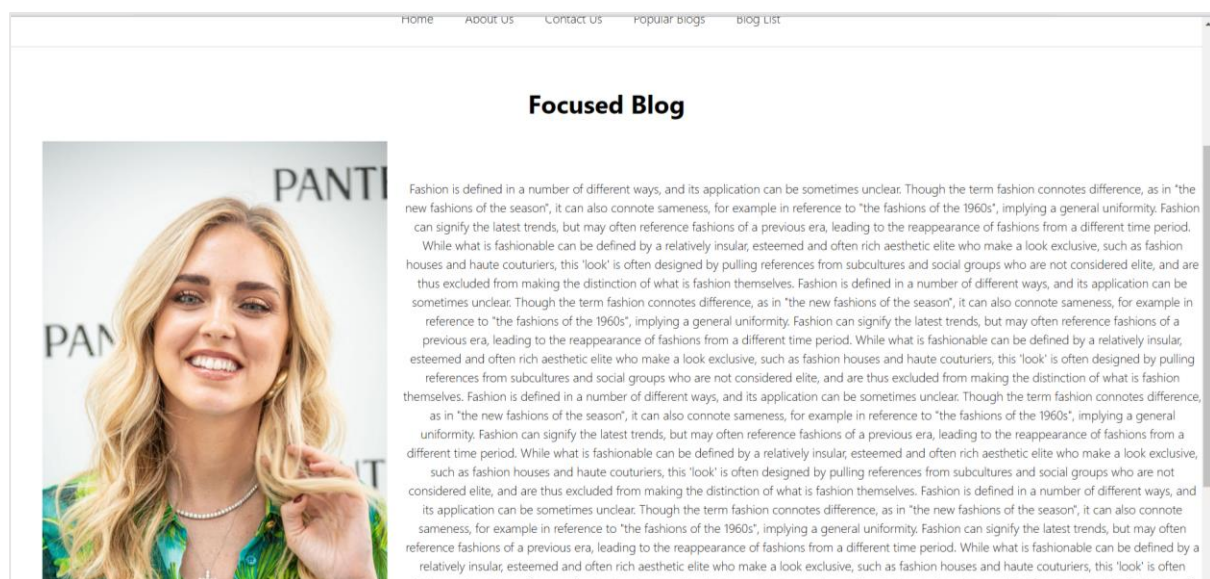

The fourth page is the “Popular Blogs” page. After the navbar in line 53, I made multiple div elements and all of them with a different class, I added an image in one, and in another, I added a span for the dates, in a href element I did a blog title that could have been linked but I didn’t need to, a paragraph and another link to another href to read more on the blog. I then copied the same code and pasted it so I would have the same thing four times, I just had to change the image so it wouldn’t be the same.

The fifth page is the “Blog List” page which then leads to the focused blog. For this page, I used the same code from the popular blogs without the date and then did different styling, I linked the “read more” to take you to a focused blog.

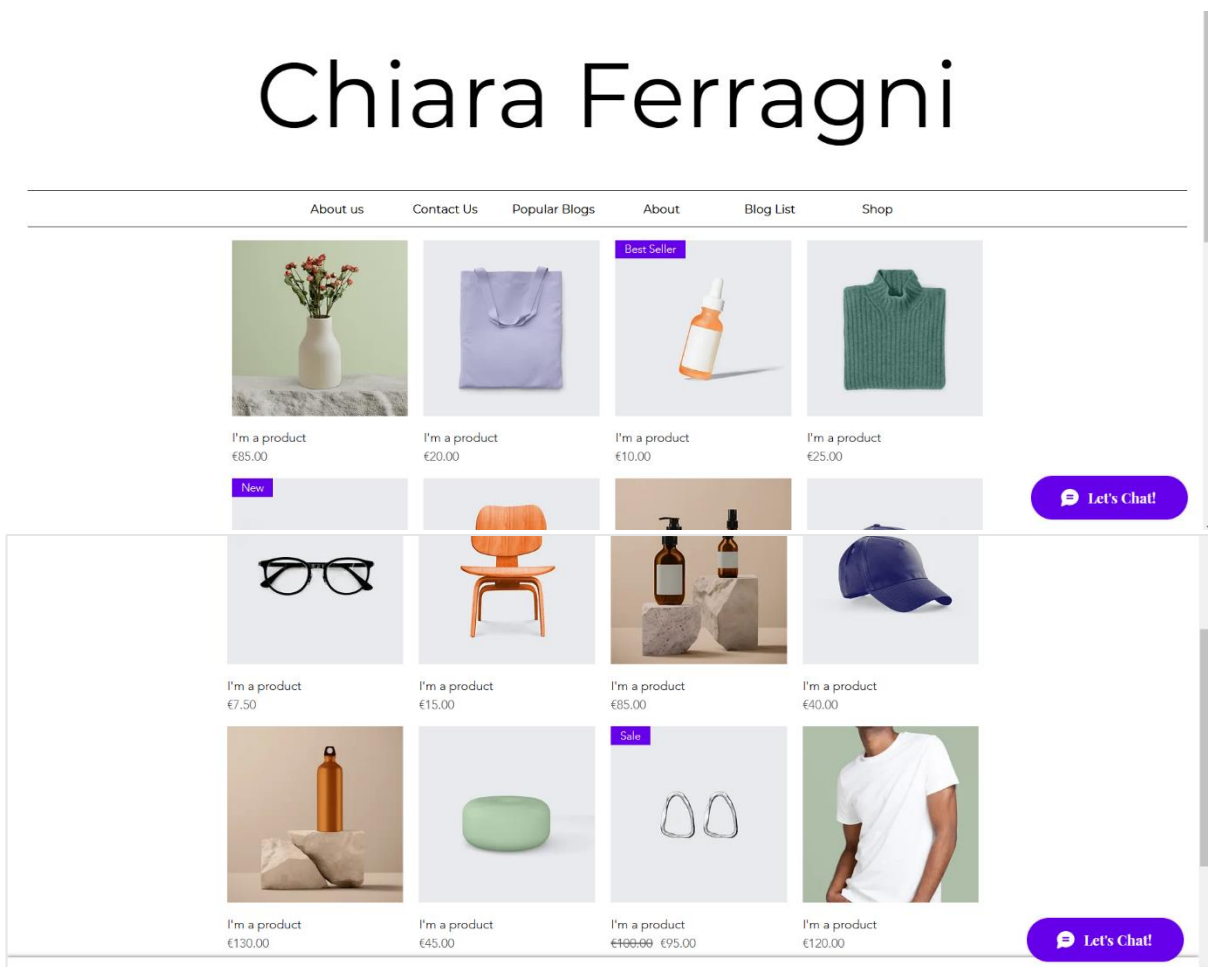

In the focused blog, I first added a header and then an image in a div element, I made some breaks after the image to get some space between the title and text and put some text in a paragraph.

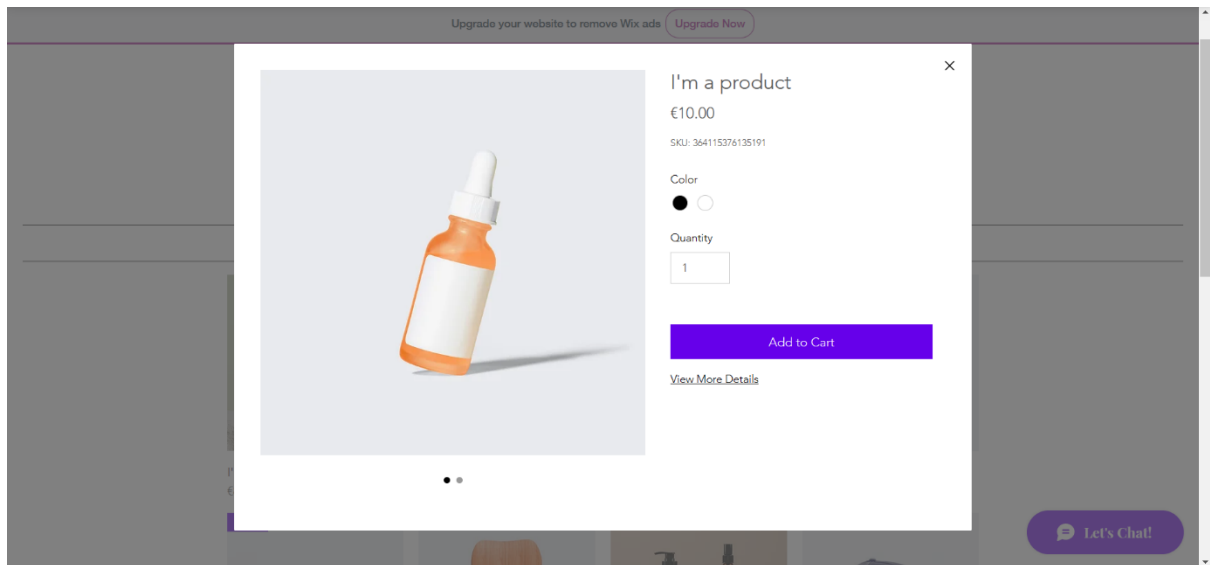

I then did all the styling after I had everything I needed on each page. The first thing I did was fix all the fonts and font sizes, then I did the navbar style by aligning them and giving them a border. The next thing were the images, I gave them all a hover effect to give more depth and fixed their sizes and position by giving a border, alignment, and a float on a side. In the “contact us” box I made a margin, and a border, and fixed the width. On the popular page, I gave the blogs an object fit, padding, and a flex direction. For the text, I made some of the important words with a hover to change the colour. The blog list had the same styling but without the date and text and gave them a different size. The positioning of the blog boxes took a while because they were moving in directions, I didn’t want them to but after I added the padding and margins they stayed put.

## 2. Select two internet services.

The two internet services I chose are E-commerce and communication services. For E-commerce I made a page called "Shop", It would have a big impact on the website because it would be more useful like this because everything is together, something I could add to the website for it to be better would probably be a shopping cart and somewhere to see more information on what the products are and where they come from.

I like this layout for online shopping because when you click on something it would show you the product without opening a new tab and it's very simple and clean.

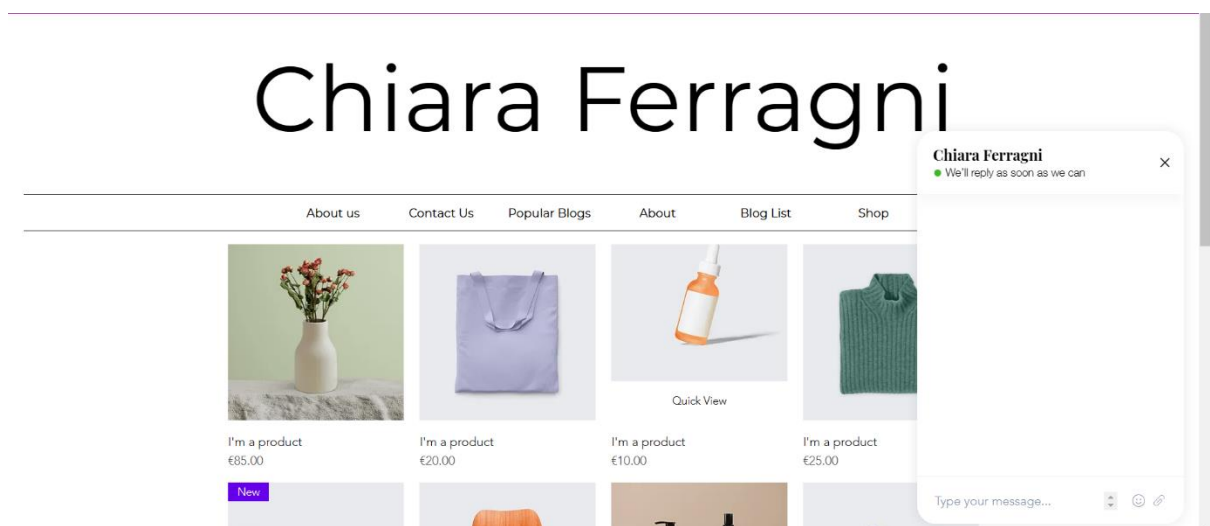

For the communication service, I made a fast chat where you can get help from workers or give feedback on something. It would be a chat via email for the worker and a direct message for the customer.

product

It would be a bubble chat and after you click it, it would open to send a message. This is very helpful if someone can't find an item or has a problem with something.
